

Energy Recovery Systems / Coil Lines

Rimara provide primary and secondary heat recovery options for our oxidisers. We design and manufacture the complete system in house. We also supply our specially developed Rimara range of heat exchangers specifically designed to perform reliably under the tough duty cycles experienced on paint coating lines.

In addition to air to air heat recovery we can also provide hot water systems thus providing process heating and/or factory and office heating.

Rimaras energy recovery systems can also be retrofitted to existing plants to improve the efficiency and running costs of the plant.

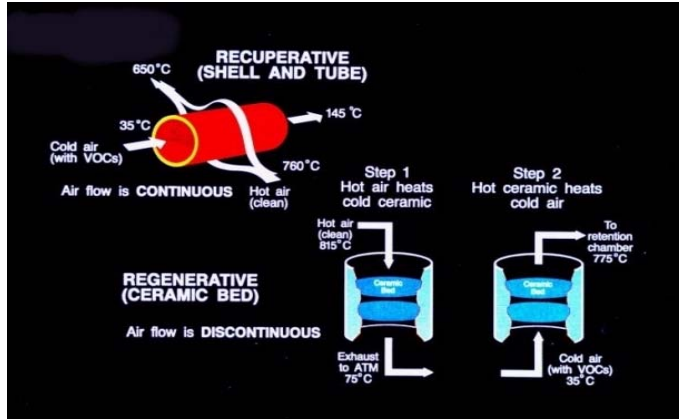

Key features:

Primary heat recovery to pre-heat fume.
(Optimised to auto therm point)

Secondary recovery for process air.

Third heat recovery using an air to water heat exchanger. (Waste heat boiler).

Rimara provide the complete package "In House" thus ensuring efficient integration of the complete system.
